

The Evolution of Smartphones

In the late 20th century, mobile phones were primarily seen as devices for making calls and sending text messages. However, with the turn of the millennium, the concept of a "smartphone" began to take shape. These were phones that could do more than just call; they could also browse the web, play music, and take photos.

The first true smartphone was introduced in the early 2000s, blending the functionalities of a personal digital assistant (PDA) with that of a mobile phone. Its touchscreen interface, ability to install applications, and connectivity options set the standard for future phone designs.

Over the years, smartphones have become more advanced, with manufacturers focusing on enhancing camera quality, increasing processing power, and ensuring longer battery life. These technological advancements have transformed the smartphone from a luxury item into an indispensable tool in our daily lives. Today, they are used for everything from navigation and online shopping to health tracking and remote work.

Exercise: Short Answer Questions

Answer the questions based on the passage. Use NO MORE THAN THREE WORDS for each answer.

1. What were mobile phones primarily used for in the late 20th century?

• _____
